Onboarding Program Recap

Onboarding Checklist

Vault Installed

- Vault Enterprise installed in your environment
- Basic configuration completed
- Telemetry and Monitoring in place
- Disaster Recovery replication in place

Vault Operational

- Getting the first use case (application)
 onboarded and consuming secrets stored in Vault
- A roadmap created for onboarding additional use cases.

Completed within 90 days

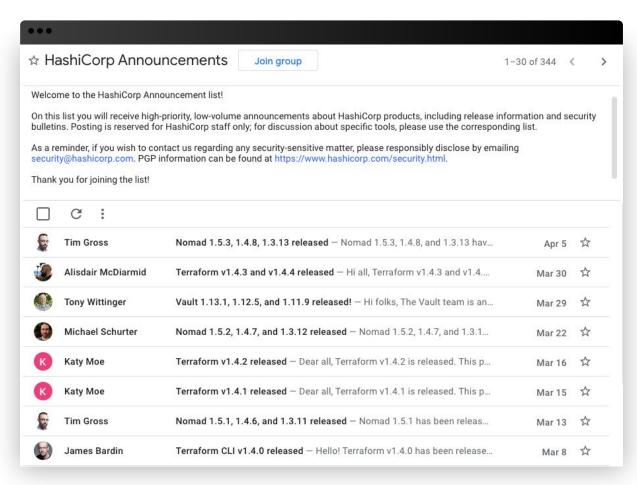

Production Readiness

Production Readiness

Join security & vulnerability announcements list

- Architecture & Infrastructure
- Vault Operations & Infrastructure Security
- Business Continuity
- Vault Policy & Configuration

Architecture & Infrastructure

- Is the cluster architecture aligned with the reference architecture?
 - Consul Storage Reference Architecture
 - Integrated Storage Reference Architecture
 - Are the nodes configured across multiple AZs / failure zones to provide resilience in accordance with your uptime requirements?
 - Are the <u>nodes sized appropriately (RAM and CPU)?</u>
 - Does the cluster have provisioned IOPS (Integrated Storage)?
- Is there less than 8 milliseconds of latency between Vault servers?
- Have high availability best practices been followed?
 - Has a process been identified and implemented to handle the lifecycle of the TLS certificates used on Vault Server listeners and load balancers?
 - How is DNS Implemented? Are appropriate TTL's configured that allow for failover that meet RTO Objectives
 - What is the validity period of TLS certificates? Is it rational?
 - Does the load balancer configuration follow <u>best practices</u>, is TLS terminated on the Vault cluster?
 - Is the renewal reminder for TLS certificates a scalable process,i.e. more than a calendar entry in a single location?

Vault Operations & Infrastructure Security

- Is root token creation restricted and monitored?
- Does the team managing Vault have runbooks and processes for all key administrative tasks?
 - Upgrading Vault
 - Executing DR failovers in Vault
 - Reissuing unseal/recovery key shares
 - Rotating Vault's master encryption key
 - Rotating any auto-unseal/seal-wrap mechanism key (if applicable)
 - Generating root tokens
- Have the <u>production hardening recommendations</u>
 been reviewed and implemented in the
 environment?
- Is the running version of Vault currently supported? N-2 window from <u>latest release</u>?

Business Continuity

- Have runbooks been created and tested to validate the ability to meet the Recovery Time Objective?
 - Have <u>snapshots been enabled</u> in alignment with the desired Recovery Point Objective?
 - Has <u>recovery from a snapshot</u> been tested and the process documented?
 - o Is there alerting in place if snapshots fail?
- Have alerts been created on the following parameters?
 - Disk space alerting on instance
 - Disk space alerting on audit points
 - Log monitoring/alerting for warn/errors
 - Draught/absence alerts on log outages/stoppages
 - RAM utilization alerting
 - CPU utilization alerting

Vault Policy & Configuration

- Are policies least-privilege?
- Are policies tested in a negative fashion, ie, ensure that a token with this policy can do what it allows but also prevents more access than intended?
